42. SW 72 Street & SW 107 Avenue intersection 92
43. SW 152 Street & SW 112 Avenue intersection 94
44. Rickenbacker Causeway near Tollbooth....96
45. 41 Street & Pinetree Drive intersection....98

Appendix A: Data Collection Forms
Appendix B: Raw Data

A. PROJECT DESCRIPTION

The Bicycle and Pedestrian Traffic Count Program involves the analysis and study of pedestrian and bicycle activities throughout Miami-Dade County, Florida. The study is a part of the National Bicycle and Pedestrian Documentation Project (NBPDP) from the Institute of Transportation Engineers (ITE) Pedestrian and Bicycle Council (BPC) as a priority effort for the organization of bicycle and pedestrian data. The objectives of the NBPDP are to establish a consistent national approach to counting and surveying bicycle and pedestrian traffic, establish a national database of bicycle and pedestrian count information, and use count and survey information to begin analysis on the correlations between various factors and bicycle and pedestrian activity.

This study will allow the Miami-Dade Metropolitan Planning Organization (MPO) to monitor areas of high activity and help plan a more efficient and safer bicycle and pedestrian network as well as assisting the NBPDP. Establishing a more efficient bicycle and pedestrian network will allow for easier access for non-motorized methods of travel. This may help offset rising fuel costs, promote healthier travel, and improve the safety of bicycle and pedestrians around the county.

The MPO selected 45 locations throughout the county for data collection. These 45 locations were selected based on existing pedestrian activities and possible future improvements. The locations were divided into two different types of data collection: point counts and intersection counts. Point counts consist of collecting pedestrian and bicycle data along a roadway segment or pedestrian facility (trail, pedestrian bridge, etc.) near a specific location. Intersection counts collect pedestrian and bicycle data at or near an intersections crosswalks. The 45 locations throughout the county can be seen in the next page.

Traffic Count Locations

ID	Type of Count	Location
1	Point	Venetian Causeway @ Rive Alto Island
2	Intersection	Washington Avenue @ 16 Street
3	Point	Collins Avenue @ 16 Street
4	Point	5 Street @ Meridian Avenue
5	Intersection	Ocean Drive @ 10 Street
6	Point	Alton Road @ 16 Street
7	Point	West Avenue @ 16 Street

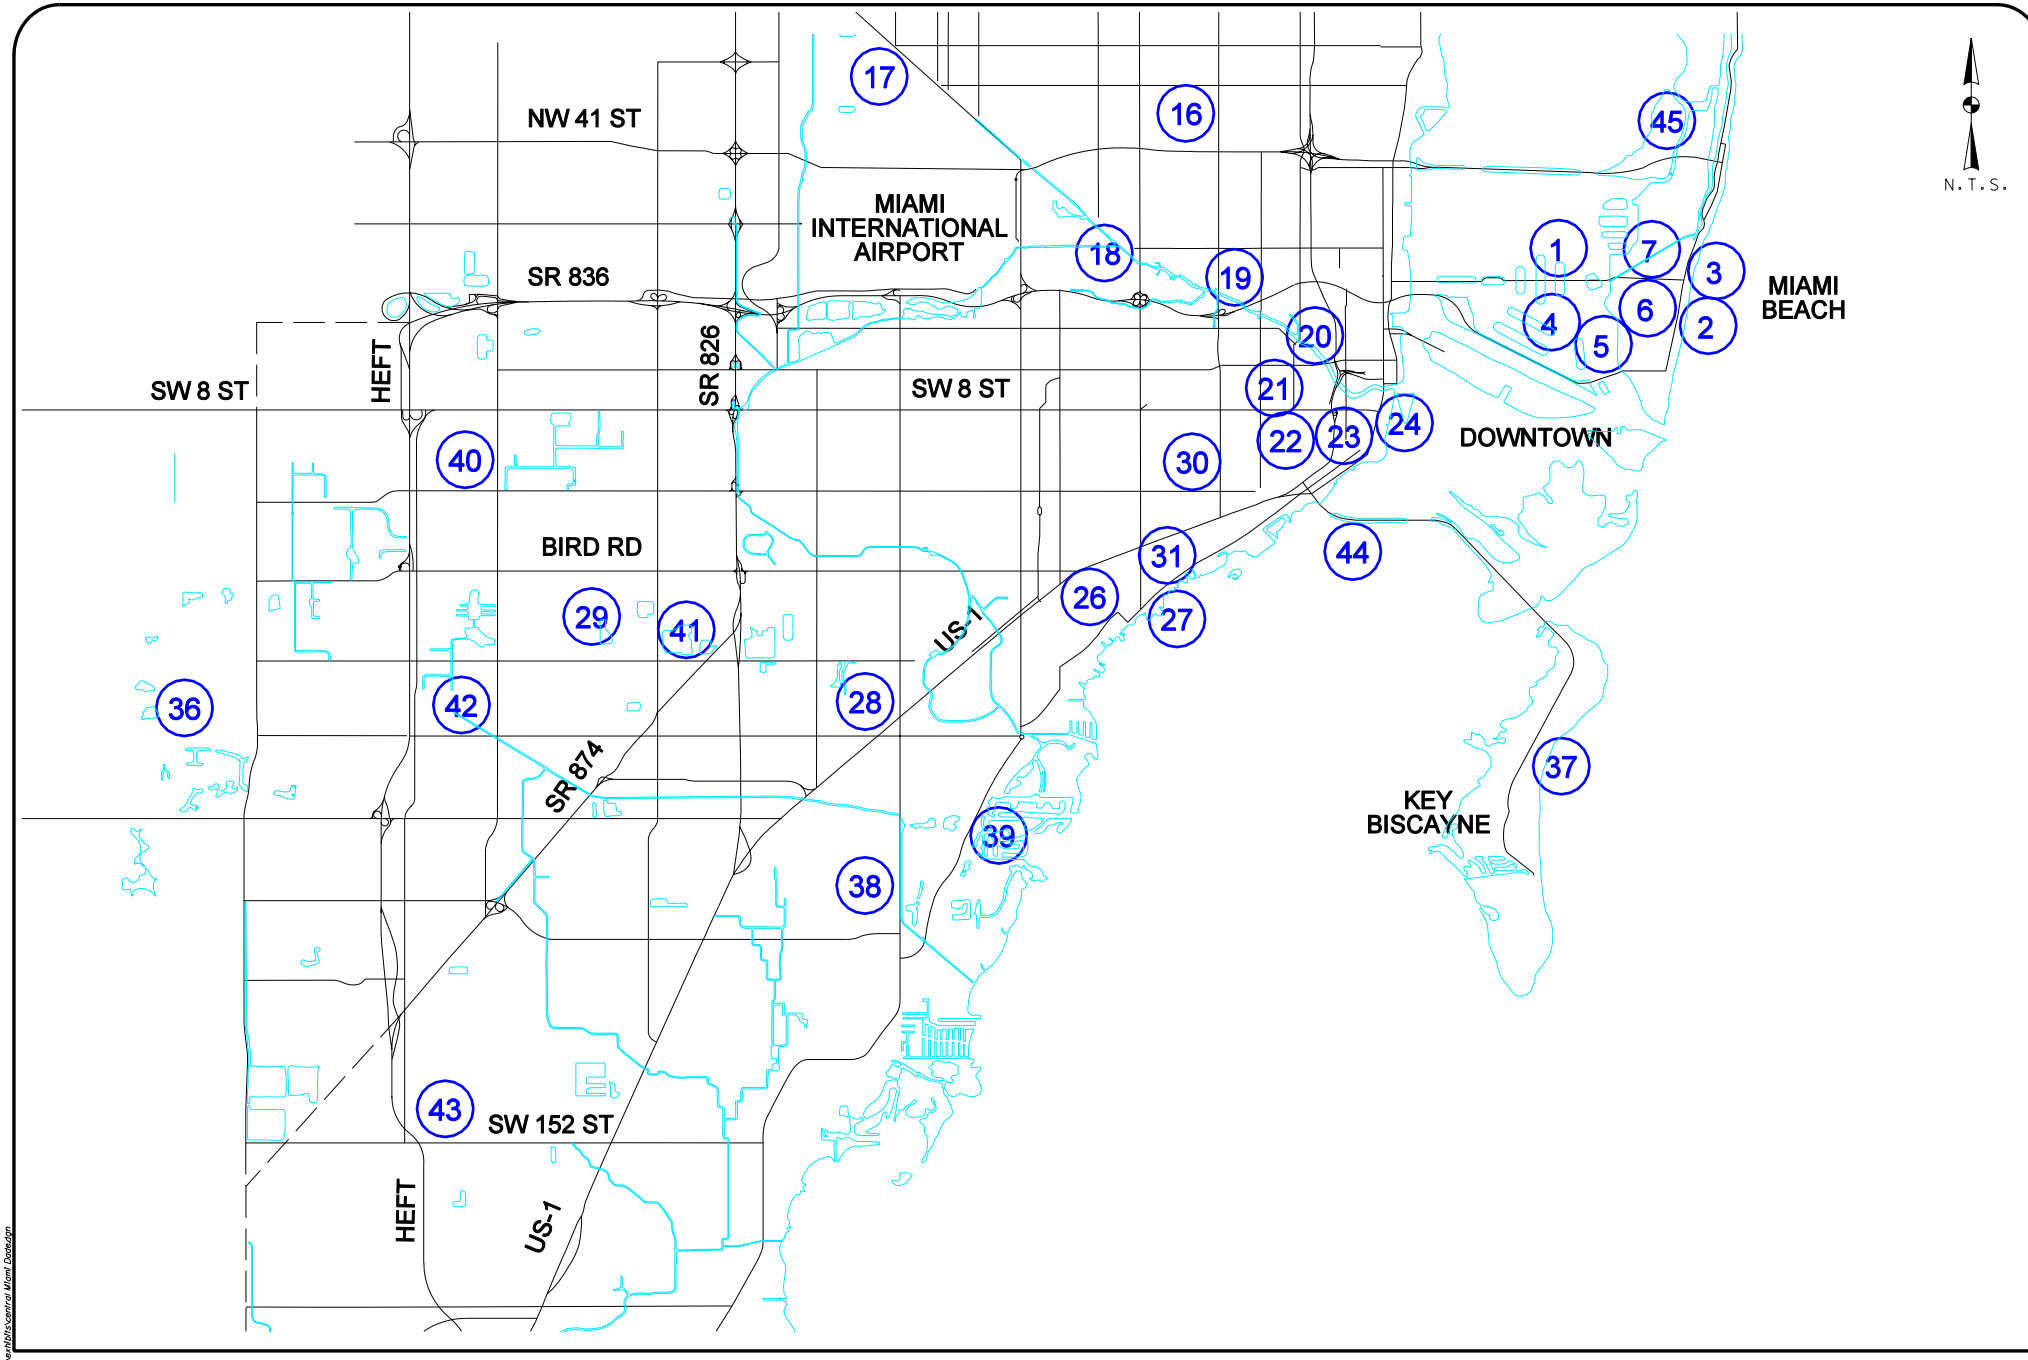
PROJECT:

BICYCLE AND PEDESTRIAN TRAFFIC COUNT PROGRAM

TITLE:

NORTH MIAMI-DADE COUNTY COUNT LOCATIONS

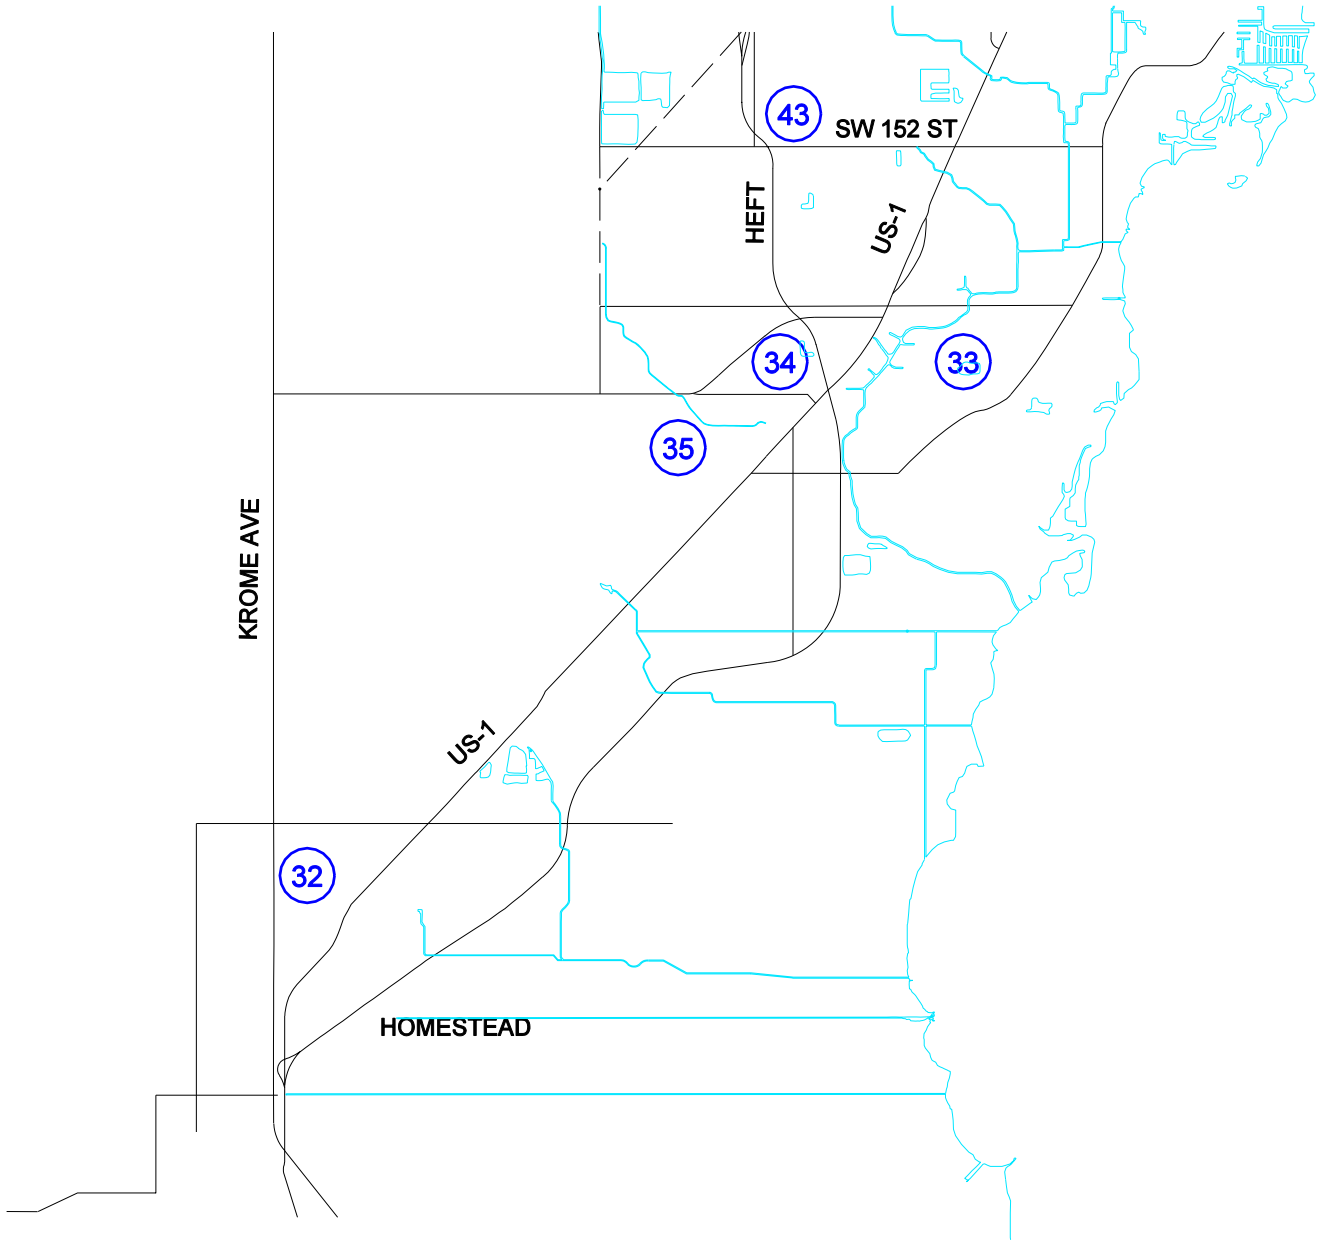


PROJECT:

BICYCLE AND PEDESTRIAN
TRAFFIC COUNT PROGRAM

TITLE:

CENTRAL MIAMI-DADE COUNTY
COUNT LOCATIONS



PROJECT:

BICYCLE AND PEDESTRIAN
TRAFFIC COUNT PROGRAM

TITLE:

SOUTH MIAMI-DADE COUNTY
COUNT LOCATIONS

Both the point and intersection counts involved collection of detailed data such as:

- mode of travel (bicycle, rollerblades, skates, scooter, jogger, walker, walker with dog, walker with stroller, wheelchair user)
- age (adult or child)
- gender
- specific bicyclist information.

The specific bicyclist information includes whether they traveled on or off street, with or against traffic flow, and with or without a helmet. The only difference between the two counts is that the point count specifies the direction traveled and the intersection counts specify the side of the intersection traveled on. The data collection forms for the point counts and intersection counts can be seen in Appendix A.

Data was collected at each location during the morning peak (7:00 AM to 9:00 AM) on a weekday and during the early afternoon (12:00 PM – 2:00 PM) on a Saturday. Higher volumes of pedestrians and bicyclists were expected during the morning during weekdays and early afternoon on a Saturday. The counts were performed for two seasons of the year: winter (January- February) and summer (July - August).

The data for each location was summarized for each period and organized. All the locations for each session where then combined and compared. The results show in general that during the weekday in the winter session, there were a total of 5,400 bicycles and pedestrians compared to 4,600 in the summer session. Likewise, during the Saturday in the winter session, there were 8,200 bicycles and pedestrians compared to 6,200 during the summer session. The ratio of ages, genders, and bicyclist helmet usage remain relatively the same.

There are several factors which may explain the difference of the bicycle and pedestrian data between the winter and summer sessions. Temperature may affect the desire to travel during the hot summer months. School is not in regular session and can affect summer travel. Also, the reduction of traffic during the summer time may prompt workers to drive more because of its ease. These factors may contribute to the lower bicycle and pedestrian figures compared with the winter session.

Additionally, the difference between the weekday and Saturday data can be due to several factors as well. On a typical Saturday, most people are not at work and people tend to frequent more retail establishments as well as recreational venues. Also, office and industrial areas experience less pedestrian and bicycle activity on a Saturday. The summary of all the locations can be seen in the following page. The summarized data for each location can be seen in section B. The raw data can be seen in Appendix B.

Winter Session Summary
